

## Get a COVID-19 Vaccine & Booster to lower risk of:

Getting  
COVID-19

Hospitalization  
from COVID-19

Death from  
COVID-19

## Get Boosted and Increase Protection Against COVID-19!

Unvaccinated

Fully Vaccinated

Fully Vaccinated +  
Boosters

## Why Children Should Get Vaccinated & Boosted

Unvaccinated children aged 5-11 years old were **2-3 times** more likely to be hospitalized during the Omicron surge.

Many children ages 5-11 years old have been vaccinated safely. Side effects have been mild.

With **natural infection**, children can suffer from long-COVID symptoms or Multi-system Inflammatory Syndrome in Children (MIS-C), even if they have a mild illness or show no symptoms at all.

Natural immunity is **less protective** than getting vaccinated and boosted and it is unknown how long natural immunity will last.

A "**mild illness**" can still cause discomfort with several days of respiratory symptoms, fever, and more. Children can also miss out on many days of school and activities.

Obten la vacuna y el refuerzo contra el COVID-19 para reducir el riesgo de:

Contagio por COVID-19

Hospitalización por COVID-19

Muerte por COVID-19

## Ponte el refuerzo y aumenta la protección contra el COVID-19!

## Por qué los niños deben vacunarse y ponerse el refuerzo
